## Carrefour or Boots ? ${ }^{1}$

In early July 2003, Laurence Dubuis was facing an important decision : which job to accept. She had just graduated from a well known business school and was considering the various job offers that she had just received.

During her MBA studies, Laurence had caught a strong interest for marketing. She was herself surprised by this new passion since her previous experience in information technology had not prepared her for this line of activity. She had sent her resume to a few large European distribution firms and had found in her mail two letters inviting her for an interview: one from Carrefour, a French firm, the other from Boots, a British firm.

Laurence was excited at the idea of working for one of these companies and she wished to impress favorably on the people that she would meet. Following the advices that she had received during her MBA, she thought that she would need to do some research on the companies and their competitors before going to the interviews.

Although finance was not her preferred topic, she considered that she needed to have some rough understanding of the financial situation of merchandising firms in Europe and in the United States. So, she downloaded the ranking of the 1,000 largest company in the world published by Business Week (July 14, 2003) (http://www.businessweek.com)
Since her time was limited, she decided to limit her analysis to Belgium, Britain, France, the Netherlands and the largest US companies in the retail industry.

She remembered her first finance class during which the instructor had explained how to do some «quick and dirty financial analysis» based on the Dupont system. This was exactly what she needed. She was hoping to get answers to the following questions:

[^0]1. How profitable are the two companies compared to others?
2. Are returns on equity due to superior operating margin? asset utilization? financing mix?
3. Which companies create the most value for their shareholders?
4. How do financial markets assess the prospects of the companies?
5. Should she wait and try another company in the business ? Which one?

## Appendix

Carrefour or Boots 2003

|  |  |  | MktValue | M/B | P/E | Sales | Profit | Assets | ROE |
